

Internal API Documentation Standards

Department: Engineering

API Versioning

All public APIs must be versioned using a URL prefix such as `/v1/`, `/v2/`. Breaking changes require a new version; backward-compatible changes do not.

Authentication

All internal APIs require a bearer token issued by the internal auth service. Tokens expire after 24 hours and must be refreshed via the `/auth/refresh` endpoint.

Documentation Requirement

Every endpoint must be documented in OpenAPI format before merging to main, including request/response schemas and example payloads.
